INS is designed to support the capability for users to access another operator's 5G networks when outside their own operator 5G coverage, enabling the continuous use of 5G services.

Operators should consider both sharing of passive infrastructure (e.g., physical site and power systems) and sharing of active infrastructure (e.g., antenna and ...

Each of the multiple cellular operators owns separate mmWave bandwidth, but shares the spectrum amongst each other while using dynamic inter-operator base station (BS) coordination ...

This paper develops a method to consider the multi-objective cooperative optimization operation of 5G communication base stations and Active Distribution Network (ADN) and constructs a description ...

Inter-Operator Base Station Coordination in Spectrum-Shared Millimeter Wave Cellular Networks Jeonghun Park, Jeffrey G. Andrews, and Robert W. Heath Jr. Abstract

In summary, the key novelty of our study is that we propose the fair backup power sharing among wireless operators as a cost-effective approach to improve the communications service quality.

By alleviating pressure of network deployment, sharing allows operators to turn their attention to improved innovation, better customer service and eventually better commercial offerings and ...

On the basis of the CBRS experience, the TAC Advanced Spectrum Sharing Working Group has hosted discussions on the topic of lessons learned about centralized spectrum sharing.

Therefore, sharing BSs among multiple operators, which can effectively reduce network construction costs and improve resource utilization, will become a new trend in 6G network planning.
