-----

This paper analyses the state of the art of floating PV, describes the design of a floating PV platform and the development of a numerical model to ...

Applications of these products include shortwave radiation measurement in agricultural, ecological, and hydrological weather networks; measurement of global solar radiation; and optimization of ...

Researchers have developed a three-step technique to estimate power generation loss in floating PV farms resulting from changes in tilt and ...

Calculations demonstrate wave deformation in severe wind, yielding heterogeneous force distributions. The compressed air flow lines align with areas characterized by high-speed flow, ...

For sites with considerable water-level variation, the system will have to be designed for extreme water-level variations as well as short-term variations due to waves or tides.

Abstract: Slope leveling is essential for the successful implementation of ground-mounted centralized photovoltaic (PV) plants, but currently, there is a lack of optimization methods available. ...

Deep cycle lead acid batteries are generally used to store the solar power generated by the PV panels, and then discharge the power when energy is required. Deep cycle batteries are not only ...

Below, a video scanning a SWIR camera across a panel of solar cells shows a large variation in EL emission, both within individual cells and across the array ...

Wave-induced movements of the PV panels can lead to varying irradiance levels, also within the string of panels, causing wave-induced loss (WIL). In this work, we have developed a ...
