-----

Using observations of galactic cosmic rays -- a type of highly energetic particle -- from NASA's Voyager spacecraft scientists calculated the ...

The simplest expression of the concept is that the solar wind blows a spherical bubble, the "heliosphere," that continually expands over the lifetime of the solar ...

To date, collisional atmospheres have been confirmed on eleven bodies in the Solar System: three terrestrial planets (Venus, Earth, and Mars), four giant planets (Jupiter, Saturn, Uranus, and ...

Our types of solar water heater system include pressurized and non-pressurized. Pressurized systems offer 24/7 hot water, sufficient flow, 95% heat absorption, ...

The troposphere extends in all solar system planets from  $> 1$  bar to a pressure level of about 0.1 bar. This is the range where most of the thermal radiation is escaping from the planetary atmosphere.

A streamlined platform for accessing astrophysics data and research resources.

This chart shows a comparison of the atmospheric compositions and pressures of the planets in our Solar System. More information about the chart is...

Greater height of a pressure surface is associated with greater pressure below because pressure increases with depth, so there is generally higher pressure towards the tropics.
